On her private Twitter profile, Julie (Juliane) describes herself as “freelance medical editor, mother, immunologist with an interest in tropical diseases and vaccines”. Julie works as a freelance medical writer and editor, is managing editor at Clear Science and is also our EMWA Twitter manager. From May to August 2015, she was teaching medical writing in Mozambique. Yes, for four months, you received EMWA tweets from the African bush! The panorama picture shows the view only 500m from the research centre, the second picture shows Julie at her internet desk – there are certainly worse places to work from!

We turned to Julie to learn more about this exciting experience. Her example shows the variety of opportunities in the field of medical writing – even teaching in Africa. What especially impressed me is that Julie did it all with three young kids (and a husband). While it was for sure a great experience for her kids, I do not envy the young kids (and a husband). While it was for sure an impression made on me to do it all with three kids (and a husband)!

What were the most challenging situations you faced? How did the situation in Mozambique differ from Europe specifically Spain where you are living now?

JC: Obviously there are differences in your everyday life; life becomes much simpler (in spite of the lack of washing machines). What we did find challenging was the corruption among traffic police or the exorbitant prices for imported food (that is, almost everything except fruit). Our daily visits to the hospital next door also opened our eyes to the human plights and showed us that neglect is not solved by simply getting the necessary resources and technical knowledge. The quiet, pleasant demeanour of the Mozambicans, the beaches and the sunny weather almost make up for all these though. A challenge of a different sort was deciding whether to eat the hippo liver we were given as a present.

MEW: You have not taught medical writing before. What did you do to prepare your course material – and what did you do to prepare yourself for living for four months on a different continent?

JC: Before we embarked on our adventure, we mainly prepared the kids (they were five and three years and 10 months old) by telling them about the impending basic life and the change of routines. One thing we prepared meticulously
was our medicine cabinet and especially the antimalarials.

**MEW: What advice can you give someone who would like to do something similar?**

**JC:** If you are interested in promoting good scientific writing among a wider community, you might want to register with AuthorAid (http://www.authoraid.info/en/). The exchange with researchers from developing countries can be helpful to both parties. Often by answering questions you are forced to think about a topic more thoroughly.

In general, being abroad is an experience that will teach you many lessons, especially about the lesser known disadvantages of developing countries. Make sure to go with an open heart and mind, and prepare to be surprised in many ways.

### Conclusion

Julie shared her adventure with us. We can learn from her experience in many different ways.

I have seen many medical writers who are not aware of their strength, only recognizing what they do not know instead of focusing on what they know. The role of a medical writer offers many opportunities, we just need to go out there and dare to do something different. If you are new to the profession and have a specific knowledge – try creating your own niche. You then should start to prepare for a new role by building upon existing knowledge (regardless how big or small it might be) and focus on your strengths. Whether you are travelling to a different country or taking on a new job – start with an open mind, set your expectations realistically, and prepare for the unexpected.

We hope that Julie’s example encourages you to dare engage in new endeavours. If she managed to take on a new job in Africa with three young kids, you will be able to achieve your dreams too!

**Letter to the Editor**

**Dear Editor,**

EMWA and other organisations (eg, AMWA, ISMPP) support the principles of Good Publication Practice (GPP). As a co-author of the recent GPP3 guideline and leader of the professional medical writer section, I was concerned by a recent article in the latest edition of EMWA’s Medical Writing journal. In their article, Prashant Auti, Rishabh Pandey, and Vatsal Shah (SIRO Clinpharm Pvt Ltd, Thane, India) include a section in which they “…review the important steps in the drafting of a manuscript.” At best, their process description is ambiguous. At worst, their process description is clear, but any of your readers who follow it could risk noncompliance with GPP3.

As per GPP3, the writer “…must receive direction from the authors at the earliest possible stage (for example before the outline is prepared).” As per GPP3, authors in the final approval of the manuscript. We have already mentioned the importance of receiving the direction from the authors in the publication process at the earliest possible stage.

We would like to explain here that the word ‘client’ is used as collective term for the ease of mentioning stakeholders in the light of agency work. We have clearly mentioned in the initiation section (page 38, column 2) that the scope should be discussed in great detail with the client so that the expectations of both parties are aligned thereby indicating the early involvement of stakeholders including authors.

Also, Dr. Woolley mentioned that we did not include authors in the final approval of the manuscript. We would like to clarify that certain stakeholders (researchers, statistics head, and the clinical team head) mentioned in the final approval of manuscript (page 40, column 2) are indeed potential authors.

Since a few terms like authors, researchers, clients and approvers are used interchangeably from the CRO standpoint, this may have led to the confusion and misinterpretation. However, we agree with editor’s suggestion to make minor changes in our paper to address Dr. Woolley’s concerns.

**Prashant Auti**

**Editor’s Response**

We agree with the comments from Dr. Woolley, and we appreciate the authors’ response. The action plan proposed for this is a kick-off meeting with the authors to get the credible data sources and to decide future directions and flow of the manuscript. This in turn highlights the importance of receiving the direction from the authors in the publication process at the earliest possible stage.

We hope that Julie’s example encourages you to dare engage in new endeavours. If she managed to take on a new job in Africa with three young kids, you will be able to achieve your dreams too!

**Author Response**

Dear Editor,

We thank Dr Woolley, co-author of GPP3, for providing her insights on our manuscript.

We have critically evaluated the comments from Dr. Woolley. As professional medical publication writers, we understand the importance of every stakeholder in the publication process and did not intend to undermine the role of authors. We have already mentioned the importance of authors throughout the manuscript. Our article proposes a project management process for publication writing projects with special emphasis on work in agencies. Our article in no way should be interpreted, analyzed or considered an extension of publication writing guidelines as it specifically focus on business aspects, process and day-to-day activities of CROs or agencies.

In Table 3 (page 41) of the manuscript, we discussed the potential risks that can arise during publication writing process and their possible resolution/action plan. In the second row from the bottom, we discussed the risk of availability of minimal data sources, which usually occurs during pre-drafting phase (preparatory activity). The action plan proposed for this is a kick-off meeting with the authors to get the credible data sources and to decide future directions and flow of the manuscript. This in turn highlights the importance of receiving the direction from the authors in the publication process at the earliest possible stage.

We would like to explain here that the word ‘client’ is used as collective term for the ease of mentioning stakeholders in the light of agency work. We have clearly mentioned in the initiation section (page 38, column 2) that the scope should be discussed in great detail with the client so that the expectations of both parties are aligned thereby indicating the early involvement of stakeholders including authors.

Also, Dr. Woolley mentioned that we did not include authors in the final approval of the manuscript. We would like to clarify that certain stakeholders (researchers, statistics head, and the clinical team head) mentioned in the final approval of manuscript (page 40, column 2) are indeed potential authors.

Since a few terms like authors, researchers, clients and approvers are used interchangeably from the CRO standpoint, this may have led to the confusion and misinterpretation. However, we agree with editor’s suggestion to make minor changes in our paper to address Dr. Woolley’s concerns.
